SUMMARY

Frontend Developer focused on building real-world web applications and turning ideas into functional, user-focused products. Strong interest in problem-solving, system thinking, and continuous improvement through hands-on, project-based development.

PROJECTS

DevDesk — Frontend Developer

July 2026 – August 2026

- Built a developer workflow platform that centralizes API requests, collections, environments, and project context within a unified development environment.
- Structured the application around a feature-based React architecture with TypeScript, separating UI components, domain logic, custom hooks, and service layers.
- Integrated Supabase and TanStack React Query to implement authentication, CRUD workflows, query caching, mutations, and server-state synchronization.
- Modeled relational data structures for users, workspaces, collections, requests, and environments using Supabase PostgreSQL to represent API workflows effectively.
- Designed a workflow-oriented dashboard that surfaces project context, identifies incomplete setup steps, and guides developers toward relevant next actions.

FormFlow — Full-Stack Developer | React, Supabase

Jun 2026 – Jul 2026

- Developed a dynamic form builder with support for multiple field types, live preview, and drag-and-drop reordering.
- Implemented CRUD workflows (create, read, update, delete) for forms, fields, and responses using Supabase PostgreSQL, Authentication, and Row Level Security.
- Designed a flexible database schema with JSON-based response storage to support varied form field configurations.
- Managed form state with React Hook Form and authentication state with Context API, while handling server state through TanStack React Query.
- Implemented a draft/publish workflow with dirty-state tracking and a public submission flow with backend validation and controlled anonymous access.

Nexus Agency OS — Full-Stack Developer | React, Supabase *May 2026- June 2026*

- Developed a multi-role agency management platform (Admin, Client, Developer) that centralizes client, project, and recruitment workflows into a unified dashboard.
- Implemented database triggers and custom JWT claims to maintain consistent user IDs across auth, clients, and projects, resolving data-integrity issues.
- Built the complete project lifecycle, including request approval and rejection with feedback, developer assignment, progress tracking, and separate client/developer portals.
- Enforced row-level security across all tables to ensure role-based data access and prevent unauthorized record visibility.
- Improved maintainability by separating services, hooks, and UI components within a feature-based architecture.

SKILLS

- HTML5
- CSS3
- JavaScript (ES6+)
- React
- Tailwind CSS
- TypeScript
- TanStack React Query
- PostgreSQL
- Supabase
- Git
- GitHub
- Vite

EDUCATION

- Azad University — **Iran**
  Software Engineering. *Sep 2018 - Sep 2023*
- AP Signals Bootcamp — **UK**
  Training in M.E.R.N full stack programming as well as soft skills development *Jul 2022- Jul 2023*

LANGUAGE

- English — Basic (Currently improving technical reading skills)

INTEREST

Outside of programming, I enjoy building personal software projects, exploring new web technologies, watching movies and anime, listening to music, and playing football.
